

In this Tutorial you will learn how to make a bootable USB flash drive. Before starting this tutorial you will have to get an ISO image for the OS you need. Also you need to download a tool to make a bootable flash drive, I recommend using windows 7 download tool or Rufus. Remember that doing this will erase all the data on your flash drive.

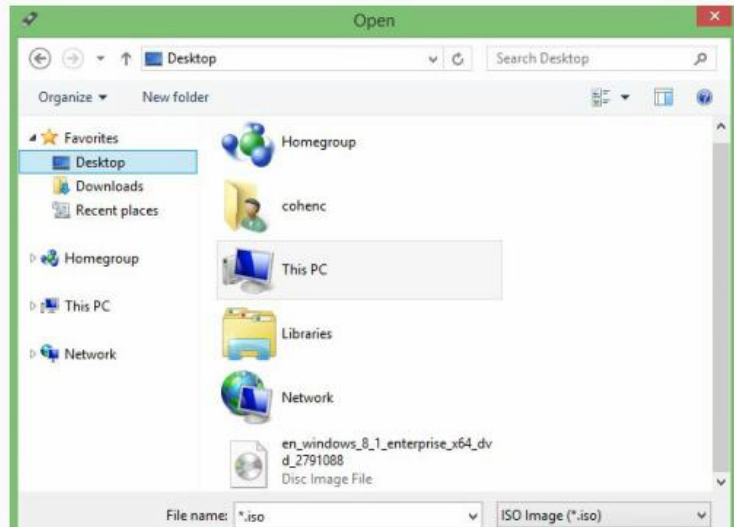

Step 1: Plug in your flash drive to the USB port on your computer. Then open the bootable flash drive tool. Now you should be able to leave all the settings default and go onto the next step.

Step 2: Now just hit the drive with the CD on it to add your ISO that you are using.

Step 3: So just search through your documents for the right ISO and double click it.

Step 4: Now just hit start and let it do its job. Once its done you can x out the program and your all set.
